

SAME TEAMWORK ASPECTS IN PROFESSIONAL ACTIVITIES OF A JOB SAFETY ENGINEER

Movmyga N., Boichenko M., Reshetnyak K.

National Technical University «Kharkiv Polytechnic Institute», Kharkiv

The production team generally combines people with different points of view, professional training, experience, knowledge and background. Synergy always arises in a successful team. Together people can understand and do more than individually. Therefore, the results grow non-linearly. Thus, the implementation of industrial safety and occupational health policy should be realized and generated non-linearly but at all levels of production cycle. The head of an enterprise, the heads of structural divisions, and operational managers must constantly learn from their daily experience and take all the necessary measures to develop a corporate culture of occupational safety.

A much more difficult task is to form a safe behavior. It is affected by many factors: the level of education, upbringing; thoughts, consciousness; the level of development and training of an employee as a specialist. At the same time, it should be noted that the level of development and degree of risk perception is very different and it should not influence on hiring a person. There are many professions where people take risks because of their professional activities, and at the same time they are extremely responsible for making decisions because they know how to analyze risks because risk is a part of their profession. Many company leaders strongly believe that incidents and injuries can be avoided if every employee is involved in preventing negative events. It is not possible without absolute control of all the processes around. At the same time, an employee must have personal responsibility for ensuring common safety both on-site and out-of-the-way.

In many large companies, there are two main tools for educating employees and forming an occupational safety culture: the initial assessment of the degree of risk acceptability. This is a mechanical tool for the initial cut of a person's character or his potential capabilities, abilities, etc.; training, without which it will be difficult to teach safe behavior, if an employee is not taught even the elementary rules that he must follow.

Thus, teamwork skills are an integral part of the professional activity of a job safety engineer.
